Address [redacted]		**City** *BREAUX BRIDGE*	**State** *LA*	**Zip Code** [redacted]
Age (At Time of Report) *61*	**Resident Status** *RESIDENT*	**Email Address**		

Opinion

Final Diagnosis

CAUSE OF DEATH: Hypertensive cardiovascular disease

MANNER OF DEATH: Natural

Summary

The decedent was a 61-year-old male prison inmate with a past medical history of [redacted] He was reportedly found foaming at the mouth in his jail cell with labored breathing. Emergency medical service was called. Resuscitative efforts were performed, but were not successful.

The autopsy revealed hypertensive cardiovascular disease manifested by nephrosclerosis and a moderately enlarged heart. An additional finding was aortic atherosclerosis. There was no trauma. Toxicology testing of blood detected metoprolol, amlodipine, acetaminophen and cyclobenzaprine. Vitreous fluid testing was remarkable for an elevated sodium level of 155 mmol/L and an elevated urea nitrogen level of 52.7 mg/dL, indicative of dehydration.

Based on all information known to me at this time, it is my opinion that Alvin Pete died as the result of hypertensive cardiovascular disease. The circumstances surrounding the death, as determined by the investigative and postmortem findings, indicate that the manner of death is natural.
